Clinical Manual of Geriatric Psychopharmacology

In the 7 years since the first edition of Clinical Manual of Geriatric Psychopharmacology was published, dozens of new drugs have been released, and older medications have been marketed in different formulations. In addition, research on pharmacokinetics, pharmacodynamics and mechanism of action, potential interactions, and other critical topics has proceeded apace, rendering much of the information in existing guides obsolete. This new volume is both comprehensive and completely up to date, offering information unavailable elsewhere. New drugs covered include asenapine, paliperidone, iloperidone, lurasidone, desvenlafaxine, vilazodone, long-acting trazodone, milnacipran, armodafinil, extended-release valproate, rotigotine transdermal, tetrabenazine, dextromethorphan, long-acting gabapentin, and transdermal buprenorphine. Each chapter has a standardized format, with topics including pharmacokinetics, pharmacodynamics and mechanism of action, drug interactions, clinical use (which addresses choice of drug, alternative formulations/routes, pre-treatment evaluation, dose and dose titration, PRN use, monitoring treatment, drug levels, managing treatment resistance, switching drugs, duration of treatment, discontinuation, and overdose), adverse effects, and treatment of selected syndromes and disorders. Dozens of tables, boxes, and figures organize and present complex material, such as practice guidelines, in a straightforward manner that is easy to understand and apply, and the concise, bulleted text facilitates reading and comprehension in the clinical setting. \"Specific Drug Summaries\" -- one-page summaries of prescribing information for individual drugs -- provide fast access to critical information in a simple format. Designed for residents, fellows, and all clinicians in psychiatry and medicine who diagnose and treat psychiatric and neuropsychiatric conditions affecting geriatric patients, this clinical reference can be used across all treatment settings (inpatient, outpatient, day hospital, consultation, and nursing home). Meticulously referenced and grounded in the latest research, Clinical Manual of Geriatric Psychopharmacology, Second Edition, is the definitive guide to psychotropic use in elderly patients. Clinicians can rely confidently on its up-to-date coverage and authoritative counsel.

Tobacco use among youth and young adults in any form, including e-cigarettes, is not safe. In recent years, e-cigarette use by youth and young adults has increased at an alarming rate. E-cigarettes are now the most commonly used tobacco product among youth in the United States. This timely report highlights the rapidly changing patterns of e-cigarette use among youth and young adults, assesses what we know about the health effects of using these products, and describes strategies that tobacco companies use to recruit our nation's youth and young adults to try and continue using e-cigarettes. The report also outlines interventions that can be adopted to minimize the harm these products cause to our nation's youth. E-cigarettes are tobacco products that deliver nicotine. Nicotine is a highly addictive substance, and many of today's youth who are using e-cigarettes could become tomorrow's cigarette smokers. Nicotine exposure can also harm brain development in ways that may affect the health and mental health of our kids. E-cigarette use among youth and young adults is associated with the use of other tobacco products, including conventional cigarettes. Because most tobacco use is established during adolescence, actions to prevent our nation's young people from the potential of a lifetime of nicotine addiction are critical. E-cigarette companies appear to be using many of the advertising tactics the tobacco industry used to persuade a new generation of young people to use their products. Companies are promoting their products through television and radio advertisements that use celebrities, sexual content, and claims of independence to glamorize these addictive products and make them appealing to young people.

Millions of Americans use e-cigarettes. Despite their popularity, little is known about their health effects. Some suggest that e-cigarettes likely confer lower risk compared to combustible tobacco cigarettes, because they do not expose users to toxicants produced through combustion. Proponents of e-cigarette use also tout the potential benefits of e-cigarettes as devices that could help combustible tobacco cigarette smokers to quit and thereby reduce tobacco-related health risks. Others are concerned about the exposure to potentially toxic substances contained in e-cigarette emissions, especially in individuals who have never used tobacco products such as youth and young adults. Given their relatively recent introduction, there has been little time for a scientific body of evidence to develop on the health effects of e-cigarettes. Public Health Consequences of E-Cigarettes reviews and critically assesses the state of the emerging evidence about e-cigarettes and health. This report makes recommendations for the improvement of this research and highlights gaps that are a priority for future research.
